Total Solar Eclipse

What is a solar eclipse?

Solar eclipses occur when the moon moves between the sun and the earth. The moon causes the light of the sun to be blocked from reaching earth, casting a shadow on earth. A total solar eclipse is when the moon completely blocks the sun. The sun's outer atmosphere (called the solar corona) glows around the moon when it is blocking the sun. A partial solar eclipse is when the moon only blocks part of the sun. Viewing a partial solar eclipse can expose your eye to the sun's rays causing damage to the eye.

Protect your eyes from the sun!

NEVER look directly at an annular or partial eclipse without wearing ASO-approved solar eclipse safety glasses. It can cause permanent retinal damage. You can view the sun during a total eclipse, but only during the very brief time the sun is in **totality** – and even then, with caution.
